Net-Zero Transition Portfolio — Markowitz

Factsheet — April 30, 2026

The Net-Zero Transition Portfolio invests in 21 developed-market companies selected and weighted using Ledoit-Wolf mean-variance optimisation (Markowitz) to maximise risk-adjusted returns while supporting alignment with net-zero emission pathways. Holdings are ESG-screened and drawn from the global energy transition universe. Portfolio constraints enforce a maximum 10% weight per issuer and a minimum 0.5% allocation. Benchmark: MSCI EAFE Index (EFA ETF).

LIMITATIONS

Transaction costs: All returns are gross of transaction costs. In practice, portfolio rebalancing generates brokerage commissions, bid-ask spreads and market-impact costs that would reduce net performance. **Management fees:** No management or administration fees have been deducted. Real-world vehicles typically charge annual management fees (e.g. 0.3–1.0% p.a.) that compound over time and materially affect long-run returns.
