

Net-Zero Transition Portfolio — Risk Parity

Factsheet — April 30, 2026

The Net-Zero Transition Portfolio invests in 40 developed-market companies weighted using a Risk Parity (Equal Risk Contribution) approach with Ledoit-Wolf shrinkage covariance estimation to equalise each holding's marginal contribution to total portfolio risk. Capital allocation relies solely on risk diversification, without dependence on return forecasts. Holdings are ESG-screened and drawn from the global energy transition universe. Benchmark: MSCI EAFE Index (EFA ETF).

KEY FACTS

Benchmark	MSCI EAFE (EFA)
Inception (backtest)	February 2021

3Y CAGR GHG (S1+S2+S3) †	-2.64%	+54.56%	Declining vs uni

LIMITATIONS

Transaction costs: All returns are gross of transaction costs. In practice, portfolio rebalancing generates brokerage commissions, bid-ask spreads and market-impact costs that would reduce net performance. **Management fees:** No management or administration fees have been deducted. Real-world vehicles typically charge annual management fees (e.g. 0.3–1.0% p.a.) that compound over time and materially affect long-run returns.
